

To keep our sprint in schedule, we identified the highest priority subtasks which would block following tasks. We distributed these among the team, keeping in mind each team member's availabilities. We did a good job of getting a lot of work done in the beginning of the sprint. We still had some unfinished tasks towards the end of the sprint because of so many term tests and assignments being due in the same week, which blocked some dependent tasks. Although this is the last sprint, we learnt that we should have done a mid-sprint checkin where we decided which tasks would immediately be redistributed if they have a high priority and have not been completed yet.
