

To keep our sprint in schedule, we identified the priorities of the tasks and distributed them accordingly depending on who is able to start their work the soonest. This way we were able to tackle the highest priority tasks first, unblocking all dependent tasks. We did however, still have some tasks being delayed due to other course assignments and tests. This temporarily blocked some team members and pushed some tasks completion until the last few days of the sprint. From this we learnt that we need to plan even better, have more check ins, and redistribute work if needed depending on each members availabilities.
